Title: **How to make your software build reproducibly**

Subtitle: Get a verifiable path from source to binary

Speaker: **Lunar**

Short: Auditing source code is not enough when build tools are themselves a target. When software can be built reproducibly, anyone is enabled to verify that binaries have actually been made from the source code they claim to be made from. The lecture will present several tricks learned while trying to make Debian the largest collection of free software build reproducibly.
