Simulacron-3

Title: **The good, bad, and ugly of photo & video metadata**

Subtitle:

Speaker: **Bashz**

**Short:** *In this talk we discuss mobile media metadata and explore how popular platforms modify such metadata towards different goals.*

**Long:** Upon taking a picture or video with your mobile device, some metadata is included within the recorded file – time/date, location, device information, software used. Once you upload that file to a website/server, you have no power over the metadata of the file, and some platforms can use such metadata for analytical purposes, while others modify the metadata which reduces the usefulness of that media for verification purposes. This talk explores some of the tech & implications of different popular platforms metadata practices.
